SUMMARY

Computer Science Engineer specializing in AI & ML with hands-on experience building full-stack and real-time backend systems using Node.js, Express.js, React, MongoDB, and PostgreSQL. Demonstrated expertise in custom algorithm design, WebSocket optimizations, and API integration. Seeking entry-level Backend / Full-Stack Software Engineering roles.

TECHNICAL SKILLS

Languages & Technical Skills: JavaScript, TypeScript, Python, C++ | React, Tailwind CSS

Backend & Databases: Node.js, REST APIs, WebSockets | PostgreSQL, MongoDB, Mongoose

Tools & Concepts: Git, GitHub, Postman | CI/CD, Docker, Nodemailer, JWT, Bcrypt

PROJECTS

Backend Ledger & Payments API | [GitHub Repo](#) | [Live URL](#)

July 2026 – Aug 2026

Node.js, Express, MongoDB, Mongoose, JWT, Bcrypt, Nodemailer

- A REST API for ledger-style money movement where account balances are never stored directly, always calculated live from an immutable ledger of transactions.
- Every transfer creates two linked entries (a debit and a credit) that are locked once written, so the transaction history can never be altered after the fact.
- Used database transactions to make transfers atomic, so a debit and its matching credit either both complete or neither does.
- Added idempotency keys so a duplicate request returns the original transaction instead of moving money twice.
- Built JWT-based authentication with logout token blacklisting, email notifications on registration and successful transfers, and a working browser playground to test every endpoint live.

Sportz – Live Sports Scoring & Commentary | [GitHub Repo](#) | [Live URL](#)

Aug 2026 – Sept 2026

React, Vite, Node.js, Express, WebSocket, PostgreSQL, Drizzle ORM, Zod, Arcjet

- Built a WebSocket push layer with per-match subscription rooms for live cricket scores, reducing unnecessary payloads by implementing change detection and broadcasting only when scores update.
- Added change detection before broadcasting so the server only pushes when the score actually changes, plus heartbeat and auto reconnect on the frontend.
- Designed tiered polling across 2 rate-limited cricket APIs (refreshing live matches every 5 min, scorecards every 90 min) with quota guards to operate within free tier limits.
- Secured and deployed the stack on Vercel and Render with Zod validation, parameterized queries, locked down CORS, and Arcjet bot detection and rate limiting, verified with live testing.

EXPERIENCE

ASPL Arctictern Pvt. Ltd. – Computer Vision Intern

Jan 2026 – May 2026

- Annotated multi-modal LiDAR and image datasets over a 5-month internship, preparing high-quality data for ADAS perception model training, producing precise 3D bounding boxes for pedestrians, cyclists, and vehicles across a five-stage QA pipeline while maintaining 85%+ accuracy per stage as validated by senior annotators using Understand.ai (dSPACE).
- Tracked and maintained annotation records across each QA stage to ensure consistency and traceability, flagging discrepancies for review and re-annotation where accuracy fell below the required threshold.

EDUCATION

B.E. Computer Science (AI & ML)

2023 - 2026

KLS Vishwanathrao Deshpande Institute of Technology **CGPA: 8.0**

CERTIFICATIONS

- Web Development Fundamentals – [IBM SkillsBuild](#)
- AWS Cloud Practitioner Essentials – [AWS SkillBuilder](#)
